RELATED APPLICATION

The present invention claims priority to U.S. Provisional Application Serial No. 60/606629, filed September 2, 2004, which is incorporated herein by reference.

BACKGROUND

10 In the 1950's the 1*H*-imidazo[4,5-*c*]quinoline ring system was developed, and 1-(6-methoxy-8-quinoliny)-2-methyl-1*H*-imidazo[4,5-*c*]quinoline was synthesized for possible use as an antimalarial agent. Subsequently, syntheses of various substituted 1*H*-imidazo[4,5-*c*]quinolines were reported. For example, 1-[2-(4-piperidyl)ethyl]-1*H*-imidazo[4,5-*c*]quinoline was synthesized as a possible anticonvulsant and cardiovascular
15 agent. Also, several 2-oxoimidazo[4,5-*c*]quinolines have been reported.

 Certain 1*H*-imidazo[4,5-*c*]quinolin-4-amines and 1- and 2-substituted derivatives thereof were later found to be useful as antiviral agents, bronchodilators and immunomodulators. Subsequently, certain substituted 1*H*-imidazo[4,5-*c*] pyridin-4-amine, quinolin-4-amine, tetrahydroquinolin-4-amine, naphthyridin-4-amine, and
20 tetrahydronaphthyridin-4-amine compounds as well as certain analogous thiazolo and oxazolo compounds were synthesized and found to be useful as immune response modifiers (IRMs), rendering them useful in the treatment of a variety of disorders.

 There continues to be interest in and a need for compounds that have the ability to modulate the immune response, by induction of cytokine biosynthesis or other
25 mechanisms.

SUMMARY OF THE INVENTION

 It has now been found that certain 1-alkoxy 1*H*-imidazo ring systems modulate cytokine biosynthesis. In one aspect, the present invention provides compounds of the
30 Formula I:

and more specifically the following compounds of the Formulas II, III, IV, V, VI, VII, VIII, IX, X, XI, XII, XIII, and XIV:

VI

VII

VIII

IX

X

XI

XII

XIII

XIV

wherein R_1 , R_2 , R_3 , R'' , R , R_A , R_B , R_{A1} , R_{B1} , m , n , p , and G are as defined below; and pharmaceutically acceptable salts thereof.

- 10 The compounds of Formulas I, II, III, IV, V, VI, VII, VIII, IX, X, XI, XII, XIII, and XIV are useful as immune response modifiers (IRMs) due to their ability to modulate cytokine biosynthesis (e.g., induce or inhibit the biosynthesis or production of one or more cytokines) and otherwise modulate the immune response when administered to animals. Compounds can be tested per the test procedures described in the Examples Section.
- 15 Compounds can be tested for induction of cytokine biosynthesis by incubating human peripheral blood mononuclear cells (PBMC) in a culture with the compound(s) at a concentration range of 30 to 0.014 μM and analyzing for interferon (α) or tumor necrosis factor (α) in the culture supernatant. Compounds can be tested for inhibition of cytokine biosynthesis by incubating mouse macrophage cell line Raw 264.7 in a culture with the
- 20 compound(s) at a single concentration of, for example, 5 μM and analyzing for tumor necrosis factor (α) in the culture supernatant. The ability to modulate cytokine biosynthesis, for example, induce the biosynthesis of one or more cytokines, makes the

compounds useful in the treatment of a variety of conditions such as viral diseases and neoplastic diseases, that are responsive to such changes in the immune response.

In another aspect, the present invention provides pharmaceutical compositions containing the immune response modifier compounds, and methods of inducing cytokine biosynthesis in animal cells, treating a viral disease in an animal, and/or treating a neoplastic disease in an animal by administering to the animal one or more compounds of the Formulas I, II, III, IV, V, VI, VII, VIII, IX, X, XI, XII, XIII, and/or XIV, and/or pharmaceutically acceptable salts thereof.

In another aspect, the invention provides methods of synthesizing the compounds of Formulas I, II, III, IV, V, VI, VII, VIII, IX, X, XI, XII, XIII, and XIV and intermediates useful in the synthesis of these compounds.

As used herein, "a," "an," "the," "at least one," and "one or more" are used interchangeably.

The terms "comprising" and variations thereof do not have a limiting meaning where these terms appear in the description and claims.

The above summary of the present invention is not intended to describe each disclosed embodiment or every implementation of the present invention. The description that follows more particularly exemplifies illustrative embodiments. Guidance is also provided herein through lists of examples, which can be used in various combinations. In each instance, the recited list serves only as a representative group and should not be interpreted as an exclusive list.

Unless otherwise specified, these groups contain from 1 to 10 20 carbon atoms, with alkenyl groups containing from 2 to 20 carbon atoms, and alkynyl groups containing from 2 to 20 carbon atoms. In some embodiments, these groups have a total of up to 10 carbon atoms, up to 8 carbon atoms, up to 6 carbon atoms, or up to 4 carbon atoms. Cyclic groups can be monocyclic or polycyclic and preferably have from 3 to 10 ring carbon atoms. Exemplary cyclic groups include cyclopropyl, 15 cyclopropylmethyl, cyclopentyl, cyclohexyl, adamantyl, and substituted and unsubstituted bornyl, norbornyl, and norbornenyl.

Unless otherwise specified, "alkylene", "-alkylene-", "alkenylene", "-alkenylene-", "alkynylene", and "-alkynylene-" are the divalent forms of the "alkyl", "alkenyl", and "alkynyl" groups defined above. The terms "alkylenyl", "alkenylenyl", and 20 "alkynylenyl" are used when "alkylene", "alkenylene", and "alkynylene", respectively, are substituted. For example, an arylalkylenyl group comprises an "alkylene" moiety to which an aryl group is attached.

The term "heteroatom" refers to the atoms O, S, or N.

30 The term "heteroaryl" includes aromatic rings or ring systems that contain at least one ring heteroatom (e.g., O, S, N). In some embodiments, the term "heteroaryl" includes a ring or ring system that contains 2 to 12 carbon atoms, 1 to 3 rings, 1 to 4 heteroatoms,

The prodrug, itself, may be an immune response modifying compound in any of the salt, solvated, polymorphic, or isomeric forms described above. The transformation may occur by various mechanisms, such as through a chemical (e.g., solvolysis or hydrolysis, for example, in the blood) or enzymatic biotransformation. A discussion of the use of prodrugs is provided by T. Higuchi and W. Stella, "Pro-drugs as Novel Delivery Systems," Vol. 14 of the A. C. S. 25 wherein R, R₁, R₂, and n are as defined above.

In step (1) of Reaction Scheme I, a 4-chloro-3-nitroquinoline of Formula XX is reduced to provide a 3-amino-4-chloroquinoline of Formula XXI. The reduction can be carried out using a conventional heterogeneous hydrogenation catalyst such as platinum on carbon or palladium on carbon. For some compounds of Formula XX, for example,
30 compounds in which R is halogen, a platinum catalyst is preferred. The reaction can be conveniently carried out on a Parr apparatus in a suitable solvent such as toluene and/or isopropanol. Many compounds of Formula XX are known or can be prepared using

known synthetic methods, see for example, U.S. Patent Nos. 4,689,338; 5,175,296; 5,367,076; and 5,389,640; and the documents cited therein. Some compounds of Formula XXI are known. For example, 3-amino-4-chloroquinoline, 3-amino-4,5-dichloroquinoline, and 3-amino-4,7-dichloroquinoline have been prepared by Surrey et al.,
5 *Journal of the American Chemical Society*, 73, pp. 2413-2416 (1951).

Other reduction processes may be used for the reduction in step (1). For example, an aqueous solution of sodium dithionite can be added to a solution or suspension of the compound of Formula XX in a suitable solvent such as ethanol or isopropanol. The reaction can be carried out at an elevated temperature, for example, at reflux, or at ambient
10 temperature.

In step (2) of Reaction Scheme I, a 3-amino-4-chloroquinoline of Formula XXI is reacted with an acyl halide of Formula $R_2C(O)Cl$ or $R_2C(O)Br$ to provide an *N*-(4-chloroquinolin-3-yl) amide of Formula XXII. The acyl halide is added to a solution of a compound of Formula XXI in a suitable solvent such as anhydrous dichloromethane
15 optionally in the presence of a base such as triethylamine. The reaction can be run at a reduced temperature, for example, 0° C, or at ambient temperature. For compounds wherein R_2 is hydrogen, the compound of Formula XXI can be reacted with a formylating agent such as, for example, diethoxymethyl acetate. Alternatively, compounds wherein R_2 is hydrogen can be prepared utilizing amidines such as *N'*-(4-chloroquinolin-3-yl)-*N,N*-
20 dimethylimidofornamide.

In step (3) of Reaction Scheme I, an *N*-(4-chloroquinolin-3-yl) amide of Formula XXII is reacted with a hydroxylamine hydrochloride of Formula $R_1ONH_2 \cdot HCl$ and cyclized to provide a 1*H*-imidazo[4,5-*c*]quinoline of Formula XXIII. The hydroxylamine hydrochloride is added to a solution of a compound of Formula XXII in an alcoholic
25 solvent. The reaction can be carried out at an elevated temperature, for example, at reflux. For example, the compound of Formula XXII and the hydroxylamine are refluxed in ethanol. Some hydroxylamine hydrochlorides of Formula $R_1ONH_2 \cdot HCl$ are commercially available, others can be prepared using known synthetic methods.

In step (4) of Reaction Scheme I, a 1*H*-imidazo[4,5-*c*]quinoline of Formula XXIII
30 is oxidized to provide an *N*-oxide of Formula XXIV using a conventional oxidizing agent that is capable of forming *N*-oxides. The reaction is carried out by treating a solution of a

compound of Formula XXIII in a suitable solvent such as chloroform or dichloromethane with 3-chloroperoxybenzoic acid at ambient temperature.

In step (5) of Reaction Scheme I, an *N*-oxide of Formula XXIV is aminated to provide a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of the Formula XXV, which is a subgenus of compounds of Formulas I, II, and IV. Step (5) can be carried out by the activation of an *N*-oxide of Formula XXIV by conversion to an ester and then reacting the ester with an aminating agent. Suitable activating agents include alkyl- or arylsulfonyl chlorides (e.g., benzenesulfonyl chloride, methanesulfonyl chloride, and *p*-toluenesulfonyl chloride). Suitable aminating agents include ammonia (e.g. in the form of ammonium hydroxide) and ammonium salts (e.g., ammonium carbonate, ammonium bicarbonate, ammonium phosphate). The reaction can be carried out by dissolving a compound of Formula XXIV in a suitable solvent such as chloroform, adding ammonium hydroxide to the solution, and then adding benzenesulfonyl chloride. The product or a pharmaceutically acceptable salt thereof can be isolated using conventional methods.

Alternatively, the oxidation of step (4) and the amination of step (5) can be carried out sequentially without isolating the product of the oxidation to provide a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of the Formula XXV. In step (4), after the 1*H*-imidazo[4,5-*c*]quinoline of Formula XXIII is consumed by reaction with 3-chloroperoxybenzoic acid as described in step (4), the aminating and acylating agents are added to the reaction mixture as in step (5). The product or a pharmaceutically acceptable salt thereof can be isolated using conventional methods.

Alternatively, step (5) can be carried out by the reaction of an *N*-oxide of Formula XXIV with trichloroacetyl isocyanate followed by hydrolysis of the resulting intermediate to provide a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of the Formula XXV. The reaction is conveniently carried out in two steps by (i) adding trichloroacetyl isocyanate to a solution of the *N*-oxide of Formula XXIV in a solvent such as dichloromethane and stirring at ambient temperature to provide an isolable amide intermediate. In step (ii), a solution of the intermediate in methanol is treated with a base such as sodium methoxide at ambient temperature. The product or a pharmaceutically acceptable salt thereof can be isolated using conventional methods.

Reaction Scheme I

Compounds of the invention can be prepared according to Reaction Scheme II

5 where R, R₁, R₂, and m are as defined above; E is carbon (imidazoquinoline ring) or nitrogen (imidazonaphthyridine ring); n is an integer from 0 to 4 (imidazoquinoline ring) or 0 to 3 (imidazonaphthyridine ring) with the proviso that when m is 1, n is 0 or 1; and D is -Br, -I, or -OCH₂Ph; wherein Ph is phenyl. In step (1) of Reaction Scheme II, an aniline or aminopyridine of Formula XXVI is treated with the condensation product
 10 generated from 2,2-dimethyl-1,3-dioxane-4,6-dione (Meldrum's acid) and triethyl orthoformate to provide an imine of Formula XXVII. The reaction is conveniently carried out by adding a solution of an aniline or aminopyridine of Formula XXVI to a heated mixture of Meldrum's acid and triethyl orthoformate and heating the reaction at an elevated temperature. Many anilines and aminopyridines of Formula XXVI are
 15 commercially available; others can be prepared by known synthetic methods. For example, benzyloxypyridines of Formula XXVI can be prepared using the method of Holladay et al., *Biorg. Med. Chem. Lett.*, 8, pp. 2797-2802, (1998).

In step (2) of Reaction Scheme II, an imine of Formula XXVII undergoes thermolysis and cyclization to provide a [1,5]naphthyridin-4-ol or a quinolin-4-ol of
 20 Formula XXVIII. The reaction is conveniently carried out in a medium such as DOWTHERM A heat transfer fluid at a temperature between 200 and 250 °C.

In step (3) of Reaction Scheme II, a [1,5]naphthyridin-4-ol or a quinolin-4-ol of Formula XXVIII is nitrated under conventional nitration conditions to provide a 3-nitro[1,5]naphthyridin-4-ol or 3-nitroquinolin-4-ol of Formula XXIX. The reaction is conveniently carried out by adding nitric acid to a compound of Formula XXVIII in a suitable solvent such as propionic acid and heating the mixture at an elevated temperature.

In step (4) of Reaction Scheme II, a 3-nitro[1,5]naphthyridin-4-ol or 3-nitroquinolin-4-ol of Formula XXIX is reduced to provide a 3-amino[1,5]naphthyridin-4-ol or 3-aminoquinolin-4-ol of Formula XXX. The reduction can be carried out using the methods described in step (1) of Reaction Scheme I.

In step (5) of Reaction Scheme II, a 3-amino[1,5]naphthyridin-4-ol or 3-aminoquinolin-4-ol of Formula XXX is chlorinated using conventional chlorination chemistry to provide a 3-amino-4-chloro[1,5]naphthyridine or 3-amino-4-chloroquinoline of Formula XXXI. The reaction is conveniently carried out by treating a compound of Formula XXX with phosphorous oxychloride in a suitable solvent such as *N,N*-dimethylformamide (DMF). The reaction can be carried out at ambient temperature or at an elevated temperature such as 100 °C.

In step (6) of Reaction Scheme II, a 3-amino-4-chloro[1,5]naphthyridine or 3-amino-4-chloroquinoline of Formula XXXI is reacted with an acyl halide of Formula $R_2C(O)Cl$ or $R_2C(O)Br$ to provide an *N*-(4-chloro[1,5]naphthyridin-3-yl) amide or *N*-(4-chloroquinolin-3-yl) amide of Formula XXXII. The reaction can be carried out using the method described in step (2) of Reaction Scheme I.

In step (7) of Reaction Scheme II, an *N*-(4-chloro[1,5]naphthyridin-3-yl) amide or *N*-(4-chloroquinolin-3-yl) amide of Formula XXXII is reacted with a hydroxylamine hydrochloride of Formula $R_1ONH_2 \cdot HCl$ and cyclized to provide a 1*H*-imidazo[4,5-*c*][1,5]naphthyridine or a 1*H*-imidazo[4,5-*c*]quinoline of Formula XXXIII. The reaction can be carried out using the method described in step (3) of Reaction Scheme I.

In steps (8) and (9) of Reaction Scheme II, a 1*H*-imidazo[4,5-*c*][1,5]naphthyridine or a 1*H*-imidazo[4,5-*c*]quinoline of Formula XXXIII is oxidized to provide an *N*-oxide of Formula XXXIV and then aminated to provide a 1*H*-imidazo[4,5-*c*][1,5]naphthyridin-4-amine or a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of the Formula XXXV, which is a subgenus of compounds of Formulas I and II. The reactions can be carried out using the

methods described in steps (4) and (5) of Reaction Scheme I, and the product or a pharmaceutically acceptable salt thereof can be isolated using conventional methods.

For some embodiments, compounds in Reaction Scheme II can be further elaborated using known synthetic methods. For example, the acid chloride used in step (6) of Reaction Scheme II may contain a protected hydroxy or amino group. Some acid chlorides of this type, for example acetoxyacetyl chloride, are commercially available. Others can be prepared by known synthetic methods. The protected hydroxy or amino group may be deprotected and further functionalized before step (8) of Reaction Scheme II. For examples of this type of functionalization of an R_2 group, see U.S. Patent No.

10 5,389,640 (Gerster et al.).

Reaction Scheme II

Compounds of the invention can be prepared according to Reaction Scheme III, where R , R_1 , R_2 , and n are as defined above, Hal is Br or I, and R_{3a} is as defined below. Formula XXXVa is a subset of Formula XXXV where D is Br or I. Compounds of

Formula XXXVa can be prepared according to the method of Reaction Scheme II.

Reaction Scheme III can be carried out using known palladium-catalyzed coupling reactions such as Suzuki coupling, Stille coupling, Sonogashira coupling, and the Heck reaction. For example, a 1*H*-imidazo[4,5-*c*][1,5]naphthyridin-4-amine or a

- 5 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XXXVa undergoes Suzuki coupling with a boronic acid of Formula $R_{3a}\text{-B(OH)}_2$, an anhydride thereof, or a boronic acid ester of Formula $R_{3a}\text{-B(O-alkyl)}_2$ to provide a 1*H*-imidazo[4,5-*c*][1,5]naphthyridin-4-amine or a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XXXVI, a subgenus of Formula II, wherein R_{3a} is -Z'-R₄', -Z'-X'-R₄', -Z'-X'-Y'-R₄', or -Z'-X'-R₅'; -Z' is a bond;
- 10 -X'- is alkenylene, arylene, heteroarylene or alkenylene optionally terminated by arylene or heteroarylene; and R₄', Y', and R₅' are as defined above. The coupling is carried out by combining a compound of Formula XXXVa with a boronic acid or an ester or anhydride thereof in the presence of palladium (II) acetate, triphenylphosphine, and a base such as sodium carbonate in a suitable solvent such as *n*-propanol. The reaction can be carried out
- 15 at an elevated temperature (e.g., 80-100°C). Numerous boronic acids of Formula $R_{3a}\text{-B(OH)}_2$, anhydrides thereof, and boronic acid esters of Formula $R_{3a}\text{-B(O-alkyl)}_2$ are commercially available; others can be readily prepared using known synthetic methods. See, for example, Li, W. et al, *J. Org. Chem.*, 67, 5394-5397 (2002). The product of Formula XXXVI or a pharmaceutically acceptable salt thereof can be isolated by
- 20 conventional methods.

The Heck reaction can also be used in Reaction Scheme III to provide compounds of Formula XXXVI, wherein R_{3a} is -Z'-X'-R₄' or -Z'-X'-Y'-R₄'; -Z' is a bond; -X'- is alkenylene optionally terminated by arylene or heteroarylene; and R₄' and Y' are as defined above. The Heck reaction is carried out by coupling a

- 25 1*H*-imidazo[4,5-*c*][1,5]naphthyridine-4-amine or a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XXXVa with a vinyl-substituted arylene or heteroarylene compound. Several vinyl-substituted arylene or heteroarylene compounds, such as 2-vinylpyridine, 3-vinylpyridine, and 4-vinylpyridine, are commercially available; others can be prepared by known methods. The reaction is conveniently carried out by combining the
- 30 1*H*-imidazo[4,5-*c*][1,5]naphthyridine-4-amine or 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XXXVa and the vinyl-substituted compound in the presence of palladium (II) acetate, triphenylphosphine or tri-*ortho*-tolylphosphine, and a base such as triethylamine

in a suitable solvent such as acetonitrile or toluene. The reaction can be carried out at an elevated temperature such as 100-120 °C under an inert atmosphere. The product or pharmaceutically acceptable salt thereof can be isolated using conventional methods.

5

Reaction Scheme III

Compounds of the invention can be prepared according to Reaction Scheme IV, where R_{A1} , R_{B1} , R_1 , and R_2 are as defined above and PMB is *para*-methoxybenzyl. In step (1) of Reaction Scheme IV, a 2,4-dichloro-3-nitropyridine of Formula XXXVII is reacted with a hydroxylamine hydrochloride of Formula $R_1\text{ONH}_2 \cdot \text{HCl}$ to provide an *N*-(2-chloro-3-nitropyridin-4-yl)hydroxylamine of Formula XXXVIII. The reaction can be carried out by combining the hydroxylamine with a compound of Formula XXXVII in the presence of a base such as triethylamine in an inert solvent such as DMF. The reaction can be carried out at an elevated temperature (about 80 °C). Many 2,4-dichloro-3-nitropyridines of the Formula XXXVII are known and can be readily prepared using known synthetic methods. (See, for example, Dellaria et al, U.S. Pat. No. 6,525,064 and the references cited therein.)

In step (2) of Reaction Scheme IV, an *N*-(2-chloro-3-nitropyridin-4-yl)hydroxylamine of Formula XXXVIII is reacted with *bis*-(4-methoxybenzyl)amine to provide an *N*-{2-[*bis*-(4-methoxybenzyl)amino]-3-nitropyridin-4-yl}hydroxylamine of Formula XXXIX. The reaction can be carried out by adding the *bis*-(4-methoxybenzyl)amine to a solution of a compound of Formula XXXVIII in a suitable solvent such as toluene in the presence of a base such as triethylamine. The reaction can be carried out at an elevated temperature (about 90 °C).

In step (3) of Reaction Scheme IV, an *N*-{2-[*bis*-(4-methoxybenzyl)amino]-3-nitropyridin-4-yl}hydroxylamine of Formula XXXIX is reduced to provide an

N-{3-amino-2-[*bis*-(4-methoxybenzyl)amino]pyridin-4-yl}hydroxylamine of Formula XL. The reduction can be carried out by treating a compound of Formula XXXIX with NiBH₄. The NiBH₄ is generated *in situ* by adding sodium borohydride to a mixture of nickel (II) chloride heptahydrate and methanol. A solution of a compound of Formula XXXIX in a
5 suitable solvent such as 9:2 methanol:dichloromethane is then added to the catalyst. The reaction can be run at ambient temperature.

In step (4) of Reaction Scheme IV, an *N*-{3-amino-2-[*bis*-(4-methoxybenzyl)amino]pyridin-4-yl}hydroxylamine of Formula XL is reacted with an acyl halide of Formula R₂C(O)Cl or R₂C(O)Br to provide an *N*-(pyridin-3-yl)amide of Formula
10 XLI. The reaction can be carried out using the method described in step (2) of Reaction Scheme I.

In step (5) of Reaction Scheme IV, an *N*-(pyridin-3-yl)amide of Formula XLI is cyclized to provide a 1*H*-imidazo[4,5-*c*]pyridine of Formula XLII. The reaction can be carried out by heating an amide of Formula XLI in toluene in the presence of pyridine
15 hydrochloride. The reaction can be carried out at an elevated temperature, for example, at reflux.

In step (6) of Reaction Scheme IV, the 4-methoxybenzyl groups on a 1*H*-imidazo[4,5-*c*]pyridine of Formula XLII are removed by acid hydrolysis to provide a 1*H*-imidazo[4,5-*c*]pyridin-4-amine of Formula III. The reaction can be carried out by
20 treating a compound of Formula XLII with trifluoroacetic acid. The reaction can be carried out at ambient temperature. The product or a pharmaceutically acceptable salt thereof can be isolated using conventional methods.

Reaction Scheme IV

Compounds of the invention can be prepared according to Reaction Scheme V

5 where R , R_1 , R_2 , and n are as defined above; and each R_a is independently alkyl. Steps (1) through (4) can be carried out as described in U.S. Patent No. 5,352,784 and documents cited therein. In step (1) the amino group of a compound of Formula XLIII can be acylated to provide a compound of Formula XLIV. The reaction can be conveniently carried out by reacting a compound of Formula XLIII with an alkyl malonyl chloride in

10 the presence of a base such as triethylamine in a suitable solvent such as dichloromethane. Certain compounds of Formula XLIII are commercially available and others can be prepared as described in U.S. Patent No. 5,352,784 and documents cited therein. Alkyl malonyl chlorides are known, some of which are commercially available, and others can be made by known methods.

In step (2) of Reaction Scheme V, a compound of Formula XLIV can be cyclized to provide a compound of Formula XLV. The reaction can be conveniently carried out by adding a solution of a compound of Formula XLIV in a suitable solvent such as tetrahydrofuran (THF) to a suspension of sodium hydride (or other base capable of removing a malonyl methylene proton) in a suitable solvent such as THF. The reaction can be run at an elevated temperature, for example, the reflux temperature.

In step (3) of Reaction Scheme V, a compound of Formula XLV can be hydrolyzed and decarboxylated to provide a compound of Formula XLVI. The reaction can be carried out by conventional methods, for example, by combining a compound of Formula XLV with an acid, such as hydrochloric acid, with heating.

In step (4) of Reaction Scheme V, a compound of Formula XLVI can be nitrated to provide a compound of Formula XLVII. The reaction can be carried out under conventional nitration conditions, such as by heating a compound of Formula XLVI in the presence of nitric acid, preferably in a solvent such as acetic acid.

In step (5) of Reaction Scheme V, a compound of Formula XLVII can be chlorinated to provide a 2,4-dichloro-3-nitro-5,6,7,8-tetrahydroquinoline of Formula XLVIII. The reaction can be carried out by combining a compound of Formula XLVII with a conventional chlorinating agent (e.g., phosphorus oxychloride, thionyl chloride, phosgene, oxalyl chloride, or phosphorus pentachloride), optionally in a solvent such as *N,N*-dimethylformamide (DMF) or dichloromethane, with heating (e.g., at the reflux temperature).

In step (6) of Reaction Scheme V, 2,4-dichloro-3-nitro-5,6,7,8-tetrahydroquinoline of Formula XLVIII is reduced to provide a 3-amino-2,4-dichloro-5,6,7,8-tetrahydroquinoline of Formula XLIX. The reduction can be carried out using the methods described in step (1) of Reaction Scheme I.

In step (7) of Reaction Scheme V, a 3-amino-2,4-dichloro-5,6,7,8-tetrahydroquinoline of Formula XLIX is reacted with an acyl halide of Formula $R_2C(O)Cl$ or $R_2C(O)Br$ to provide an *N*-(4-chloro-5,6,7,8-tetrahydroquinolin-3-yl) amide of Formula L. The reaction can be carried out using the method described in step (2) of Reaction Scheme I.

In step (8) of Reaction Scheme V, an *N*-(4-chloro-5,6,7,8-tetrahydroquinolin-3-yl) amide of Formula L is reacted with a hydroxylamine hydrochloride of Formula

R₁ONH₂•HCl and cyclized to provide a 4-chloro-6,7,8,9-tetrahydro-1*H*-imidazo[4,5-*c*]quinoline of Formula LI. The reaction can be carried out using the method described in step (3) of Reaction Scheme I.

5 In step (9) of Reaction Scheme V, 4-chloro-6,7,8,9-tetrahydro-1*H*-imidazo[4,5-*c*]quinoline of Formula LI is aminated to provide a 6,7,8,9-tetrahydro-1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula V. The reaction can be carried out by heating (e.g., 125-175°C) a compound of Formula LI under pressure in a sealed reactor in the presence of a solution of ammonia in an alkanol. The product or a pharmaceutically acceptable salt thereof can be isolated using conventional methods.

10

Reaction Scheme V

Compounds of the invention can be prepared according to Reaction Scheme VI
 5 where R , R_1 , R_2 , D , E , m , and n are as defined above.

In step (1) of Reaction Scheme VI, a 3-amino[1,5]naphthyridin-4-ol or 3-aminoquinolin-4-ol of Formula XXX is reacted with an acyl halide of Formula $R_2C(O)Cl$ or $R_2C(O)Br$ to provide an *N*-(4-hydroxy[1,5]naphthyridin-3-yl) amide or *N*-(4-hydroxyquinolin-3-yl) amide of Formula LVIII. The reaction can be carried out using the
 10 method described in step (2) of Reaction Scheme I.

In step (2) of Reaction Scheme VI, an *N*-(4-hydroxy[1,5]naphthyridin-3-yl) amide or *N*-(4-hydroxyquinolin-3-yl) amide of Formula LVIII is reacted with a triflating reagent such as *N*-phenyl-bis(trifluoromethanesulfonamide) to provide a [1,5]naphthyridin-3-yl trifluoromethanesulfonate or quinolin-3-yl trifluoromethanesulfonate of Formula LIX. A mixture of a compound of Formula LVIII, the triflating agent, a base, such as triethylamine, and an inert solvent, such as DMF, is heated at an elevated temperature, such as 75 °C.

In step (3) of Reaction Scheme VI, a [1,5]naphthyridin-3-yl trifluoromethanesulfonate or quinolin-3-yl trifluoromethanesulfonate of Formula LIX is reacted with a hydroxylamine hydrochloride of Formula $R_1ONH_2 \cdot HCl$ and cyclized to provide a 1*H*-imidazo[4,5-*c*][1,5]naphthyridine or a 1*H*-imidazo[4,5-*c*]quinoline of Formula XXXIII. The reaction can be carried out using the method described in step (3) of Reaction Scheme I.

In steps (4) and (5) of Reaction Scheme VI, a 1*H*-imidazo[4,5-*c*][1,5]naphthyridine or a 1*H*-imidazo[4,5-*c*]quinoline of Formula XXXIII is oxidized to provide an *N*-oxide of Formula XXXIV and then aminated to provide a 1*H*-imidazo[4,5-*c*][1,5]naphthyridin-4-amine or a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of the Formula XXXV, which is a subgenus of compounds of Formulas I and II. The reactions can be carried out using the methods described in steps (4) and (5) of Reaction Scheme I, and the product or a pharmaceutically acceptable salt thereof can be isolated using conventional methods.

Reaction Scheme VI

Compounds of the invention can be prepared according to Reaction Scheme VII where R, R₂, R₄, D, E, X, Y, m, and n are as defined above and Boc is *tert*-butoxycarbonyl.

5 In step (1) of Reaction Scheme VII, an *N*-(4-chloro[1,5]naphthyridin-3-yl) amide or *N*-(4-chloroquinolin-3-yl) amide of Formula XXXII is reacted with a hydroxylamine of the Formula Boc-CH₂-X-CH₂-ONH₂ and cyclized to provide a 1*H*-imidazo[4,5-*c*][1,5]naphthyridine or a 1*H*-imidazo[4,5-*c*]quinoline of Formula LX. The reaction can be carried out using the method described in step (3) of Reaction Scheme I.

10 Hydroxylamines of the Formula Boc-CH₂-X-CH₂-ONH₂ can be prepared by conventional methods.

In step (2) of Reaction Scheme VII, the *tert*-butoxycarbonyl protecting group is removed under acidic conditions to provide an amino substituted 1*H*-imidazo[4,5-*c*][1,5]naphthyridine or 1*H*-imidazo[4,5-*c*]quinoline of Formula LXI. For example, a
15 compound of Formula LX can be combined with a solution of hydrogen chloride in ethanol and heated.

In step (3) of Reaction Scheme VII, an amino substituted 1*H*-imidazo[4,5-*c*][1,5]naphthyridine or 1*H*-imidazo[4,5-*c*]quinoline of Formula LXI is converted to a substituted 1*H*-imidazo[4,5-*c*][1,5]naphthyridine or 1*H*-imidazo[4,5-*c*]quinoline of
20 Formula LXII using conventional methods. For example, a 1*H*-imidazo[4,5-*c*][1,5]naphthyridine or a 1*H*-imidazo[4,5-*c*]quinoline of the Formula LXI can react with an acid chloride of Formula R₄C(O)Cl to provide a compound of Formula LXII in which Y is -C(O)-. In addition, a compound of the Formula LXI can react with sulfonyl chloride of Formula R₄S(O)₂Cl or a sulfonic anhydride of Formula (R₄S(O)₂)₂O to provide a
25 compound of Formula LXII in which Y is -S(O)₂-. A compound of the Formula LXI can also react with a chloroformate of Formula R₄CO(O)Cl to provide a compound of Formula LXII in which Y is -C(O)-O-. Numerous acid chlorides of Formula R₄C(O)Cl, sulfonyl chlorides of Formula R₄S(O)₂Cl, sulfonic anhydrides of Formula (R₄S(O)₂)₂O, and chloroformates of Formula R₄CO(O)Cl are commercially available; others can be readily
30 prepared using known synthetic methods. The reaction can be conveniently carried out by adding the acid chloride of Formula R₄C(O)Cl, chloroformate of Formula R₄CO(O)Cl, sulfonyl chloride of Formula R₄S(O)₂Cl, or sulfonic anhydride of Formula (R₄S(O)₂)₂O to

a solution of a compound of Formula LXI and a base such as triethylamine in a suitable solvent such as chloroform, dichloromethane, or acetonitrile. The reaction can be carried out at ambient temperature or at a sub-ambient temperature such as 0 °C.

Ureas of Formula LXII, where Y is -C(R₇)-N(R₉)-, in which R₇ is =O, and R₉ is as defined above, can be prepared by reacting a compound of Formula LXI with isocyanates of Formula R₄N=C=O. Numerous isocyanates of Formula R₄N=C=O are commercially available; others can be readily prepared using known synthetic methods. The reaction can be conveniently carried out by adding the isocyanate of Formula R₄N=C=O to a cooled solution of a compound of Formula LXI in a suitable solvent such as dichloromethane or chloroform. Optionally, a base such as triethylamine can be added. The reaction can be carried out at ambient temperature or at a sub-ambient temperature such as 0 °C. Alternatively, a compound of Formula LXI can be treated with carbamoyl chlorides of Formula R₄N-(R₉)-C(O)Cl or Formula

where A, a, and b are as defined above.

Thioureas of the Formula LXII, where Y is -C(R₇)-N(R₉)-, in which R₇ is =S, and R₉ is H, can be prepared by reacting a compound of Formula LXI with thioisocyanates of Formula R₄N=C=S using the conditions described above for the reaction of a compound of Formula LXI with isocyanates.

Sulfamides of Formula LXII, where Y is -S(O)₂-N(R₆)- wherein R₆ is as defined above, can be prepared by reacting a compound of Formula LXI with sulfonyl chloride to generate a sulfamoyl chloride in situ, and then reacting the sulfamoyl chloride with an amine of formula HN(R₆)R₄. Alternatively, sulfamides of Formula LXII can be prepared by reacting a compound of Formula LXI with a sulfamoyl chloride of Formula R₄(R₆)N-S(O)₂Cl under the reaction conditions described above for reaction of compounds of Formula LXI with sulfonyl chlorides. Many amines of Formula HN(R₆)R₄, and some sulfamoyl chlorides of Formula R₄(R₆)N-S(O)₂Cl are commercially available; others can be prepared using known synthetic methods.

In steps (4) and (5) of Reaction Scheme VII, a 1*H*-imidazo[4,5-*c*][1,5]naphthyridine or a 1*H*-imidazo[4,5-*c*]quinoline of Formula LXII is oxidized to

provide an *N*-oxide of Formula LXIII and then aminated to provide a 1*H*-imidazo[4,5-*c*][1,5]naphthyridin-4-amine or a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of the Formula LXIV. Reaction Scheme VII

Compounds of the invention can also be prepared using the synthetic routes described in the EXAMPLES below.

Prodrugs can be prepared in a variety of ways. For example, a compound wherein R_2 is hydroxyalkyl can be converted into a prodrug wherein R_2 is, for example, -alkylenyl-O-C(R_7)- R_4 , -alkylenyl-O-C(R_7)-O- R_4 , or -alkylenyl-O-C(R_7)-N(R_6)- R_4 , wherein R_4 , R_6 , and R_7 are as defined above, using methods known to one skilled in the art. In addition, a compound wherein R is hydroxy may also be converted to an ester, an ether, a carbonate, or a carbamate. For any of these compounds containing an alcohol functional group, a prodrug can be formed by the replacement of the hydrogen atom of the alcohol group with a group such as C_{1-6} alkanoyloxymethyl, 1-(C_{1-6} alkanoyloxy)ethyl, 1-methyl-1-(C_{1-6} alkanoyloxy)ethyl, C_{1-6} alkoxycarbonyloxymethyl, *N*-(C_{1-6} alkoxycarbonyl)aminomethyl, succinoyl, C_{1-6} alkanoyl, α -amino C_{1-4} alkanoyl, arylacyl, -P(O)(OH)₂, -P(O)(O- C_{1-6} alkyl)₂, C_{1-6} alkoxycarbonyl, C_{1-6} alkylcarbamoyl, and α -aminoacyl or α -aminoacyl- α -aminoacyl, where each α -aminoacyl group is

independently selected from the naturally occurring racemic, D-, and L-amino acids. For compounds containing an alcohol functional group, particularly useful prodrugs are esters made from carboxylic acids containing one to six carbon atoms, unsubstituted or substituted benzoic acid esters, or esters made from naturally occurring L-amino acids.

5 Prodrugs can also be made from a compound containing an amino group by conversion of the amino group to a functional group such as an amide, carbamate, urea, amidine, or another hydrolyzable group using conventional methods. A prodrug of this type can be made by the replacement of a hydrogen atom in an amino group, particularly the amino group at the 4-position, with a group such as -C(O)-R', α -aminoacyl,
 10 α -aminoacyl- α -aminoacyl, -C(O)-O-R', -C(O)-N(R''')-R', -C(=NY₂)-R', -CH(OH)-C(O)-OY₂, -CH(OC₁₋₄ alkyl)Y₀, -CH₂Y₁, or -CH(CH₃)Y₁; wherein R' and R''' are each independently C₁₋₁₀ alkyl, C₃₋₇ cycloalkyl, phenyl, or benzyl, each of which may be unsubstituted or substituted by one or more substituents selected from the group consisting of halogen, hydroxy, nitro, cyano, carboxy, C₁₋₆ alkyl, C₁₋₄ alkoxy, aryl,
 15 heteroaryl, arylC₁₋₄ alkylenyl, heteroarylC₁₋₄ alkylenyl, haloC₁₋₄ alkyl, haloC₁₋₄ alkoxy, -O-C(O)-CH₃, -C(O)-O-CH₃, -C(O)-NH₂, -O-CH₂-C(O)-NH₂, -NH₂, and -S(O)₂-NH₂; each α -aminoacyl group is independently selected from the naturally occurring racemic, D-, and L-amino acids; Y₂ is hydrogen, C₁₋₆ alkyl, or benzyl; Y₀ is C₁₋₆ alkyl, carboxyC₁₋₆ alkyl, aminoC₁₋₄ alkyl, mono-*N*-C₁₋₆ alkylaminoC₁₋₄ alkyl, or
 20 di-*N,N*-C₁₋₆ alkylaminoC₁₋₄ alkyl; and Y₁ is mono-*N*-C₁₋₆ alkylamino, di-*N,N*-C₁₋₆ alkylamino, morpholin-4-yl, piperidin-1-yl, pyrrolidin-1-yl, or 4-C₁₋₄ alkylpiperazin-1-yl.

Pharmaceutical Compositions and Biological Activity

25 Pharmaceutical compositions of the invention contain a therapeutically effective amount of a compound or salt of the invention as described above in combination with a pharmaceutically acceptable carrier.

The terms "a therapeutically effective amount" and "effective amount" mean an amount of the compound or salt sufficient to induce a therapeutic or prophylactic effect,
 30 such as cytokine induction, immunomodulation, antitumor activity, and/or antiviral activity. Although the exact amount of active compound or salt used in a pharmaceutical composition of the invention will vary according to factors known to those of skill in the

art, such as the physical and chemical nature of the compound or salt, the nature of the carrier, and the intended dosing regimen, it is anticipated that the compositions of the invention will contain sufficient active ingredient to provide a dose of about 100 nanograms per kilogram (ng/kg) to about 50 milligrams per kilogram (mg/kg), preferably about 10 micrograms per kilogram ($\mu\text{g/kg}$) to about 5 mg/kg, of the compound or salt to the subject. A variety of dosage forms may be used, such as tablets, lozenges, capsules, parenteral formulations, syrups, creams, ointments, aerosol formulations, transdermal patches, transmucosal patches and the like.

The compounds or salts of the invention can be administered as the single therapeutic agent in the treatment regimen, or the compounds or salts of the invention may be administered in combination with one another or with other active agents, including additional immune response modifiers, antivirals, antibiotics, antibodies, proteins, peptides, oligonucleotides, etc.

Compounds or salts of the invention have been shown to induce, and certain compounds or salts of the invention may inhibit, the production of certain cytokines in experiments performed according to the tests set forth below. These results indicate that the compounds or salts are useful as immune response modifiers that can modulate the immune response in a number of different ways, rendering them useful in the treatment of a variety of disorders.

Cytokines whose production may be induced by the administration of compounds or salts of the invention generally include interferon- α (IFN- α) and/or tumor necrosis factor- α (TNF- α) as well as certain interleukins (IL). Cytokines whose biosynthesis may be induced by compounds or salts of the invention include IFN- α , TNF- α , IL-1, IL-6, IL-10 and IL-12, and a variety of other cytokines. Among other effects, these and other cytokines can inhibit virus production and tumor cell growth, making the compounds or salts useful in the treatment of viral diseases and neoplastic diseases. Accordingly, the invention provides a method of inducing cytokine biosynthesis in an animal comprising administering an effective amount of a compound or salt or composition of the invention to the animal. The animal to which the compound or salt or composition is administered for induction of cytokine biosynthesis may have a disease as described *infra*, for example a viral disease or a neoplastic disease, and administration of the compound or salt may provide therapeutic treatment. Alternatively, the compound or salt may be administered to

the animal prior to the animal acquiring the disease so that administration of the compound or salt may provide a prophylactic treatment.

In addition to the ability to induce the production of cytokines, compounds or salts of the invention can affect other aspects of the innate immune response. For example, natural killer cell activity may be stimulated, an effect that may be due to cytokine induction. The compounds or salts may also activate macrophages, which in turn stimulate secretion of nitric oxide and the production of additional cytokines. Further, the compounds or salts may cause proliferation and differentiation of B-lymphocytes.

Compounds or salts of the invention can also have an effect on the acquired immune response. For example, the production of the T helper type 1 (T_H1) cytokine IFN- γ may be induced indirectly and the production of the T helper type 2 (T_H2) cytokines IL-4, IL-5 and IL-13 may be inhibited upon administration of the compounds or salts.

Other cytokines whose production may be inhibited by the administration of compounds or salts of the invention include tumor necrosis factor- α (TNF- α). Among other effects, inhibition of TNF- α production can provide prophylaxis or therapeutic treatment of TNF- α mediated diseases in animals, making the compounds or salt useful in the treatment of, for example, autoimmune diseases. Accordingly, the invention provides a method of inhibiting TNF- α biosynthesis in an animal comprising administering an effective amount of a compound or salt or composition of the invention to the animal. The animal to which the compound or salt or composition is administered for inhibition of TNF- α biosynthesis may have a disease as described *infra*, for example an autoimmune disease, and administration of the compound or salt may provide therapeutic treatment. Alternatively, the compound or salt may be administered to the animal prior to the animal acquiring the disease so that administration of the compound or salt may provide a prophylactic treatment.

Whether for prophylaxis or therapeutic treatment of a disease, and whether for effecting innate or acquired immunity, the compound or salt or composition may be administered alone or in combination with one or more active components as in, for example, a vaccine adjuvant. When administered with other components, the compound or salt and other component or components may be administered separately; together but independently such as in a solution; or together and associated with one another such as (a) covalently linked or (b) non-covalently associated, e.g., in a colloidal suspension.

Conditions for which compounds or salts identified herein may be used as treatments include, but are not limited to:

(a) viral diseases such as, for example, diseases resulting from infection by an adenovirus, a herpesvirus (e.g., HSV-I, HSV-II, CMV, or VZV), a poxvirus (e.g., an orthopoxvirus such as variola or vaccinia, or molluscum contagiosum), a picornavirus (e.g., rhinovirus or enterovirus), an orthomyxovirus (e.g., influenzavirus), a paramyxovirus (e.g., parainfluenzavirus, mumps virus, measles virus, and respiratory syncytial virus (RSV)), a coronavirus (e.g., SARS), a papovavirus (e.g., papillomaviruses, such as those that cause genital warts, common warts, or plantar warts), a hepadnavirus (e.g., hepatitis B virus), a flavivirus (e.g., hepatitis C virus or Dengue virus), or a retrovirus (e.g., a lentivirus such as HIV);

(c) other infectious diseases, such as chlamydia, fungal diseases including but not limited to candidiasis, aspergillosis, histoplasmosis, cryptococcal meningitis, or parasitic diseases including but not limited to malaria, pneumocystis carinii pneumonia, leishmaniasis, cryptosporidiosis, toxoplasmosis, and trypanosome infection;

(d) neoplastic diseases, such as intraepithelial neoplasias, cervical dysplasia, actinic keratosis, basal cell carcinoma, squamous cell carcinoma, renal cell carcinoma, Kaposi's sarcoma, melanoma, leukemias including but not limited to myelogenous leukemia, chronic lymphocytic leukemia, multiple myeloma, non-Hodgkin's lymphoma, cutaneous T-cell lymphoma, B-cell lymphoma, and hairy cell leukemia, and other cancers;

(e) T_H2 -mediated, atopic diseases, such as atopic dermatitis or eczema, eosinophilia, asthma, allergy, allergic rhinitis, and Ommen's syndrome;

(f) certain autoimmune diseases such as systemic lupus erythematosus, essential thrombocythaemia, multiple sclerosis, discoid lupus, alopecia areata; and

(g) diseases associated with wound repair such as, for example, inhibition of keloid formation and other types of scarring (e.g., enhancing wound healing, including chronic wounds).

Additionally, a compound or salt of the present invention may be useful as a vaccine adjuvant for use in conjunction with any material that raises either humoral and/or cell mediated immune response, such as, for example, live viral, bacterial, or parasitic immunogens; inactivated viral, tumor-derived, protozoal, organism-derived, fungal, or bacterial immunogens, toxoids; toxins; self-antigens; polysaccharides; proteins; glycoproteins; peptides; cellular vaccines; DNA vaccines; autologous vaccines; recombinant proteins; and the like, for use in connection with, for example, BCG, cholera, plague, typhoid, hepatitis A, hepatitis B, hepatitis C, influenza A, influenza B, parainfluenza, polio, rabies, measles, mumps, rubella, yellow fever, tetanus, diphtheria, hemophilus influenza b, tuberculosis, meningococcal and pneumococcal vaccines, adenovirus, HIV, chicken pox, cytomegalovirus, dengue, feline leukemia, fowl plague, HSV-1 and HSV-2, hog cholera, Japanese encephalitis, respiratory syncytial virus, rotavirus, papilloma virus, yellow fever, and Alzheimer's Disease.

Compounds or salts of the present invention may be particularly helpful in individuals having compromised immune function. For example, compounds or salts may be used for treating the opportunistic infections and tumors that occur after suppression of cell mediated immunity in, for example, transplant patients, cancer patients and HIV patients.

Thus, one or more of the above diseases or types of diseases, for example, a viral disease or a neoplastic disease may be treated in an animal in need thereof (having the disease) by administering a therapeutically effective amount of a compound or salt of the invention to the animal.

An amount of a compound or salt effective to induce or inhibit cytokine biosynthesis is an amount sufficient to cause one or more cell types, such as monocytes, macrophages, dendritic cells and B-cells to produce an amount of one or more cytokines such as, for example, IFN- α , TNF- α , IL-1, IL-6, IL-10 and IL-12 that is increased (induced) or decreased (inhibited) over a background level of such cytokines. The precise amount will vary according to factors known in the art but is expected to be a dose of about 100 ng/kg to about 50 mg/kg, preferably about 10 μ g/kg to about 5 mg/kg. The

invention also provides a method of treating a viral infection in an animal and a method of treating a neoplastic disease in an animal comprising administering an effective amount of a compound or salt or composition of the invention to the animal. An amount effective to treat or inhibit a viral infection is an amount that will cause a reduction in one or more of the manifestations of viral infection, such as viral lesions, viral load, rate of virus production, and mortality as compared to untreated control animals. The precise amount that is effective for such treatment will vary according to factors known in the art but is expected to be a dose of about 100 ng/kg to about 50 mg/kg, preferably about 10 µg/kg to about 5 mg/kg. An amount of a compound or salt effective to treat a neoplastic condition is an amount that will cause a reduction in tumor size or in the number of tumor foci. Again, the precise amount will vary according to factors known in the art but is expected to be a dose of about 100 ng/kg to about 50 mg/kg, preferably about 10 µg/kg to about 5 mg/kg.

In addition to the formulations and uses described specifically herein, other formulations, uses, and administration devices suitable for compounds of the present invention are described in, for example, International Publication Nos. WO 03/077944 and WO 02/036592, U.S. Patent No. 6,245,776, and U.S. Publication Nos. 2003/0139364, 2003/185835, 2004/0258698, 2004/0265351, 2004/076633, and 2005/0009858.

Objects and advantages of this invention are further illustrated by the following examples, but the particular materials and amounts thereof recited in these examples, as well as other conditions and details, should not be construed to unduly limit this invention.

Compounds of the invention have been found to modulate cytokine biosynthesis by inducing the production of interferon α and/or tumor necrosis factor α in human cells when tested using the method described below.

5

CYTOKINE INDUCTION IN HUMAN CELLS

An in vitro human blood cell system is used to assess cytokine induction. Activity is based on the measurement of interferon (α) and tumor necrosis factor (α) (IFN- α and TNF- α , respectively) secreted into culture media as described by Testerman et al. in "Cytokine Induction by the Immunomodulators Imiquimod and S-27609," *Journal of Leukocyte Biology*, 58, 365-372 (September, 1995).

10

Blood Cell Preparation for Culture

Whole blood from healthy human donors is collected by venipuncture into vacutainer tubes or syringes containing EDTA. Peripheral blood mononuclear cells (PBMC) are separated from whole blood by density gradient centrifugation using HISTOPAQUE-1077 (Sigma, St. Louis, MO) or Ficoll-Paque Plus (Amersham Biosciences Piscataway, NJ). Blood is diluted 1:1 with Dulbecco's Phosphate Buffered Saline (DPBS) or Hank's Balanced Salts Solution (HBSS). Alternately, whole blood is placed in Accuspin (Sigma) or LeucoSep (Greiner Bio-One, Inc., Longwood, FL) centrifuge frit tubes containing density gradient medium. The PBMC layer is collected and washed twice with DPBS or HBSS and re-suspended at 4×10^6 cells/mL in RPMI complete. The PBMC suspension is added to 96 well flat bottom sterile tissue culture plates containing an equal volume of RPMI complete media containing test compound.

15

20

25

Compound Preparation

The compounds are solubilized in dimethyl sulfoxide (DMSO). The DMSO concentration should not exceed a final concentration of 1% for addition to the culture wells. The compounds are generally tested at concentrations ranging from 30-0.014 μ M. Controls include cell samples with media only, cell samples with DMSO only (no compound), and cell samples with reference compound.

30

Incubation

The solution of test compound is added at 60 μ M to the first well containing RPMI complete and serial 3 fold dilutions are made in the wells. The PBMC suspension is then added to the wells in an equal volume, bringing the test compound concentrations to the
5 desired range (usually 30-0.014 μ M). The final concentration of PBMC suspension is 2×10^6 cells/mL. The plates are covered with sterile plastic lids, mixed gently and then incubated for 18 hours to 24 hours at 37°C in a 5% carbon dioxide atmosphere.

Separation

10 Following incubation the plates are centrifuged for 10 minutes at 1000 rpm (approximately 200 x g) at 4°C. The cell-free culture supernatant is removed and transferred to sterile polypropylene tubes. Samples are maintained at -30°C to -70°C until analysis. The samples are analyzed for IFN- α by ELISA and for TNF- α by
15 IGEN/BioVeris Assay.

Interferon (α) and Tumor Necrosis Factor (α) Analysis

IFN- α concentration is determined with a human multi-subtype colorimetric sandwich ELISA (Catalog Number 41105) from PBL Biomedical Laboratories, Piscataway, NJ. Results are expressed in pg/mL.

20 The TNF- α concentration is determined by ORIGEN M-Series Immunoassay and read on an IGEN M-8 analyzer from BioVeris Corporation, formerly known as IGEN International, Gaithersburg, MD. The immunoassay uses a human TNF- α capture and detection antibody pair (Catalog Numbers AHC3419 and AHC3712) from Biosource International, Camarillo, CA. Results are expressed in pg/mL.

Assay Data and Analysis

25 In total, the data output of the assay consists of concentration values of TNF- α and IFN- α (y-axis) as a function of compound concentration (x-axis).

30 Analysis of the data has two steps. First, the greater of the mean DMSO (DMSO control wells) or the experimental background (usually 20 pg/mL for IFN- α and 40 pg/mL for TNF- α) is subtracted from each reading. If any negative values result from background subtraction, the reading is reported as " * ", and is noted as not reliably

detectable. In subsequent calculations and statistics, " * ", is treated as a zero. Second, all background subtracted values are multiplied by a single adjustment ratio to decrease experiment to experiment variability. The adjustment ratio is the area of the reference compound in the new experiment divided by the expected area of the reference compound based on the past 61 experiments (unadjusted readings). This results in the scaling of the reading (y-axis) for the new data without changing the shape of the dose-response curve. The reference compound used is 2-[4-amino-2-ethoxymethyl-6,7,8,9-tetrahydro- α,α -dimethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl]ethanol hydrate (U.S. Patent No. 5,352,784; Example 91) and the expected area is the sum of the median dose values from the past 61 experiments.

The minimum effective concentration is calculated based on the background-subtracted, reference-adjusted results for a given experiment and compound. The minimum effective concentration (μ molar) is the lowest of the tested compound concentrations that induces a response over a fixed cytokine concentration for the tested cytokine (usually 20 pg/mL for IFN- α and 40 pg/mL for TNF- α). The maximal response is the maximal amount of cytokine (pg/ml) produced in the dose-response.

CYTOKINE INDUCTION IN HUMAN CELLS (High Throughput Screen)

The CYTOKINE INDUCTION IN HUMAN CELLS test method described above was modified as follows for high throughput screening.

Blood Cell Preparation for Culture

Whole blood from healthy human donors is collected by venipuncture into vacutainer tubes or syringes containing EDTA. Peripheral blood mononuclear cells (PBMC) are separated from whole blood by density gradient centrifugation using HISTOPAQUE-1077 (Sigma, St. Louis, MO) or Ficoll-Paque Plus (Amersham Biosciences Piscataway, NJ). Whole blood is placed in Accuspin (Sigma) or LeucoSep (Greiner Bio-One, Inc., Longwood, FL) centrifuge frit tubes containing density gradient medium. The PBMC layer is collected and washed twice with DPBS or HBSS and re-suspended at 4×10^6 cells/mL in RPMI complete (2-fold the final cell density). The PBMC suspension is added to 96-well flat bottom sterile tissue culture plates.

Compound Preparation

The compounds are solubilized in dimethyl sulfoxide (DMSO). The compounds are generally tested at concentrations ranging from 30 - 0.014 μ M. Controls include cell samples with media only, cell samples with DMSO only (no compound), and cell samples with a reference compound 2-[4-amino-2-ethoxymethyl-6,7,8,9-tetrahydro- α,α -dimethyl-1H-imidazo[4,5-c]quinolin-1-yl]ethanol hydrate (U.S. Patent No. 5,352,784; Example 91) on each plate. The solution of test compound is added at 7.5 mM to the first well of a dosing plate and serial 3 fold dilutions are made for the 7 subsequent concentrations in DMSO. RPMI Complete media is then added to the test compound dilutions in order to reach a final compound concentration of 2-fold higher (60 - 0.028 μ M) than the final tested concentration range.

Incubation

Compound solution is then added to the wells containing the PBMC suspension bringing the test compound concentrations to the desired range (usually 30 μ M - 0.014 μ M) and the DMSO concentration to 0.4%. The final concentration of PBMC suspension is 2×10^6 cells/mL. The plates are covered with sterile plastic lids, mixed gently and then incubated for 18 to 24 hours at 37°C in a 5% carbon dioxide atmosphere.

Separation

Following incubation the plates are centrifuged for 10 minutes at 1000 rpm (approximately 200 g) at 4°C. 4-plex Human Panel MSD MULTI-SPOT 96-well plates are pre-coated with the appropriate capture antibodies by MesoScale Discovery, Inc. (MSD, Gaithersburg, MD). The cell-free culture supernatants are removed and transferred to the MSD plates. Fresh samples are typically tested, although they may be maintained at -30°C to -70°C until analysis.

Interferon- α and Tumor Necrosis Factor- α Analysis

MSD MULTI-SPOT plates contain within each well capture antibodies for human TNF- α and human IFN- α that have been pre-coated on specific spots. Each well contains four spots: one human TNF- α capture antibody (MSD) spot, one human IFN- α capture

antibody (PBL Biomedical Laboratories, Piscataway, NJ) spot, and two inactive bovine serum albumin spots. The human TNF- α capture and detection antibody pair is from MesoScale Discovery. The human IFN- α multi-subtype antibody (PBL Biomedical Laboratories) captures all IFN- α subtypes except IFN- α F (IFNA21). Standards consist of
5 recombinant human TNF- α (R&D Systems, Minneapolis, MN) and IFN- α (PBL Biomedical Laboratories). Samples and separate standards are added at the time of analysis to each MSD plate. Two human IFN- α detection antibodies (Cat. Nos. 21112 & 21100, PBL) are used in a two to one ratio (weight:weight) to each other to determine the IFN- α concentrations. The cytokine-specific detection antibodies are labeled with the
10 SULFO-TAG reagent (MSD). After adding the SULFO-TAG labeled detection antibodies to the wells, each well's electrochemoluminescent levels are read using MSD's SECTOR HTS READER. Results are expressed in pg/mL upon calculation with known cytokine standards.

15 Assay Data and Analysis

In total, the data output of the assay consists of concentration values of TNF- α or IFN- α (y-axis) as a function of compound concentration (x-axis).

A plate-wise scaling is performed within a given experiment aimed at reducing plate-to-plate variability associated within the same experiment. First, the greater of the
20 median DMSO (DMSO control wells) or the experimental background (usually 20 pg/mL for IFN- α and 40 pg/mL for TNF- α) is subtracted from each reading. Negative values that may result from background subtraction are set to zero. Each plate within a given experiment has a reference compound that serves as a control. This control is used to calculate a median expected area under the curve across all plates in the assay. A plate-
25 wise scaling factor is calculated for each plate as a ratio of the area of the reference compound on the particular plate to the median expected area for the entire experiment. The data from each plate are then multiplied by the plate-wise scaling factor for all plates. Only data from plates bearing a scaling factor of between 0.5 and 2.0 (for both cytokines IFN- α , TNF- α) are reported. Data from plates with scaling factors outside the above-
30 mentioned interval are retested until they bear scaling factors inside the above mentioned interval. The above method produces a scaling of the y-values without altering the shape of the curve. The reference compound used is 2-[4-amino-2-ethoxymethyl-6,7,8,9-

tetrahydro- α,α -dimethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl]ethanol hydrate (U.S. Patent No. 5,352,784; Example 91). The median expected area is the median area across all plates that are part of a given experiment.

A second scaling may also be performed to reduce inter-experiment variability (across multiple experiments). All background-subtracted values are multiplied by a single adjustment ratio to decrease experiment-to-experiment variability. The adjustment ratio is the area of the reference compound in the new experiment divided by the expected area of the reference compound based on an average of previous experiments (unadjusted readings). This results in the scaling of the reading (y-axis) for the new data without changing the shape of the dose-response curve. The reference compound used is 2-[4-amino-2-ethoxymethyl-6,7,8,9-tetrahydro- α,α -dimethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl]ethanol hydrate (U.S. Patent No. 5,352,784; Example 91) and the expected area is the sum of the median dose values from an average of previous experiments.

The minimum effective concentration is calculated based on the background-subtracted, reference-adjusted results for a given experiment and compound. The minimum effective concentration (μ molar) is the lowest of the tested compound concentrations that induces a response over a fixed cytokine concentration for the tested cytokine (usually 20 pg/mL for IFN- α and 40 pg/mL for TNF- α). The maximal response is the maximal amount of cytokine (pg/ml) produced in the dose-response.

Certain compounds of the invention may modulate cytokine biosynthesis by inhibiting production of tumor necrosis factor α (TNF- α) when tested using the method described below.

TNF- α INHIBITION IN MOUSE CELLS

The mouse macrophage cell line Raw 264.7 is used to assess the ability of compounds to inhibit tumor necrosis factor- α (TNF- α) production upon stimulation by lipopolysaccharide (LPS).

Single Concentration Assay:
Blood Cell Preparation for Culture

Raw cells (ATCC) are harvested by gentle scraping and then counted. The cell suspension is brought to 3×10^5 cells/mL in RPMI with 10 % fetal bovine serum (FBS). Cell suspension (100 μ L) is added to 96-well flat bottom sterile tissues culture plates (Becton Dickinson Labware, Lincoln Park, NJ). The final concentration of cells is 3×10^4 cells/well. The plates are incubated for 3 hours. Prior to the addition of test compound the medium is replaced with colorless RPMI medium with 3 % FBS.

Compound Preparation

The compounds are solubilized in dimethyl sulfoxide (DMSO). The DMSO concentration should not exceed a final concentration of 1% for addition to the culture wells. Compounds are tested at 5 μ M. LPS (Lipopolysaccharide from *Salmonella typhimurium*, Sigma-Aldrich) is diluted with colorless RPMI to the EC₇₀ concentration as measured by a dose response assay.

Incubation

A solution of test compound (1 μ L) is added to each well. The plates are mixed on a microtiter plate shaker for 1 minute and then placed in an incubator. Twenty minutes later the solution of LPS (1 μ L, EC₇₀ concentration \sim 10 ng/ml) is added and the plates are mixed for 1 minute on a shaker. The plates are incubated for 18 to 24 hours at 37 °C in a 5 % carbon dioxide atmosphere.

TNF- α Analysis

Following the incubation the supernatant is removed with a pipet. TNF- α concentration is determined by ELISA using a mouse TNF- α kit (from Biosource International, Camarillo, CA). Results are expressed in pg/mL. TNF- α expression upon LPS stimulation alone is considered a 100% response.

Dose Response Assay:

Blood Cell Preparation for Culture

Raw cells (ATCC) are harvested by gentle scraping and then counted. The cell suspension is brought to 4×10^5 cells/mL in RPMI with 10 % FBS. Cell suspension (250 μ L) is added to 48-well flat bottom sterile tissues culture plates (Costar, Cambridge, MA).

The final concentration of cells is 1×10^5 cells/well. The plates are incubated for 3 hours. Prior to the addition of test compound the medium is replaced with colorless RPMI medium with 3 % FBS.

5 Compound Preparation

The compounds are solubilized in dimethyl sulfoxide (DMSO). The DMSO concentration should not exceed a final concentration of 1% for addition to the culture wells. Compounds are tested at 0.03, 0.1, 0.3, 1, 3, 5 and 10 μ M. LPS (Lipopolysaccharide from *Salmonella typhimurium*, Sigma-Aldrich) is diluted with
10 colorless RPMI to the EC₇₀ concentration as measured by dose response assay.

Incubation

A solution of test compound (200 μ L) is added to each well. The plates are mixed on a microtiter plate shaker for 1 minute and then placed in an incubator. Twenty minutes
15 later the solution of LPS (200 μ L, EC₇₀ concentration approximately 10 ng/ml) is added and the plates are mixed for 1 minute on a shaker. The plates are incubated for 18 to 24 hours at 37 °C in a 5 % carbon dioxide atmosphere.

TNF- α Analysis

20 Following the incubation the supernatant is removed with a pipet. TNF- α concentration is determined by ELISA using a mouse TNF- α kit (from Biosource International, Camarillo, CA). Results are expressed in pg/mL. TNF- α expression upon LPS stimulation alone is considered a 100% response.
